AZURE DEPLOYMENT AND APPLICATION VERIFICATION REPORT

Project Name: TextForge
Team Name: QUARK
Problem Statement ID: UC-06 — Text Processing Tool SaaS
Cloud Platform: Microsoft Azure
Report Version: 1.0

---

1. Deployment Overview

The Text Processing Tool SaaS application has been prepared for deployment on Microsoft Azure. This report documents the application's deployment details, live user interface, deployed application version, Azure resources, verification status, and instructions for accessing and running the application.

The application provides text validation and processing capabilities through a web interface and backend API. It is designed to support tenant-based access, subscription plans, usage quotas, and processing history.

Deployment Status: Successfully Deployed

2. Live Application URL

Live UI URL: [TextForge URL]

Deployment Verification: Verified

The live URL provides access to the deployed application's user interface.

Screenshot 1 — Live Application

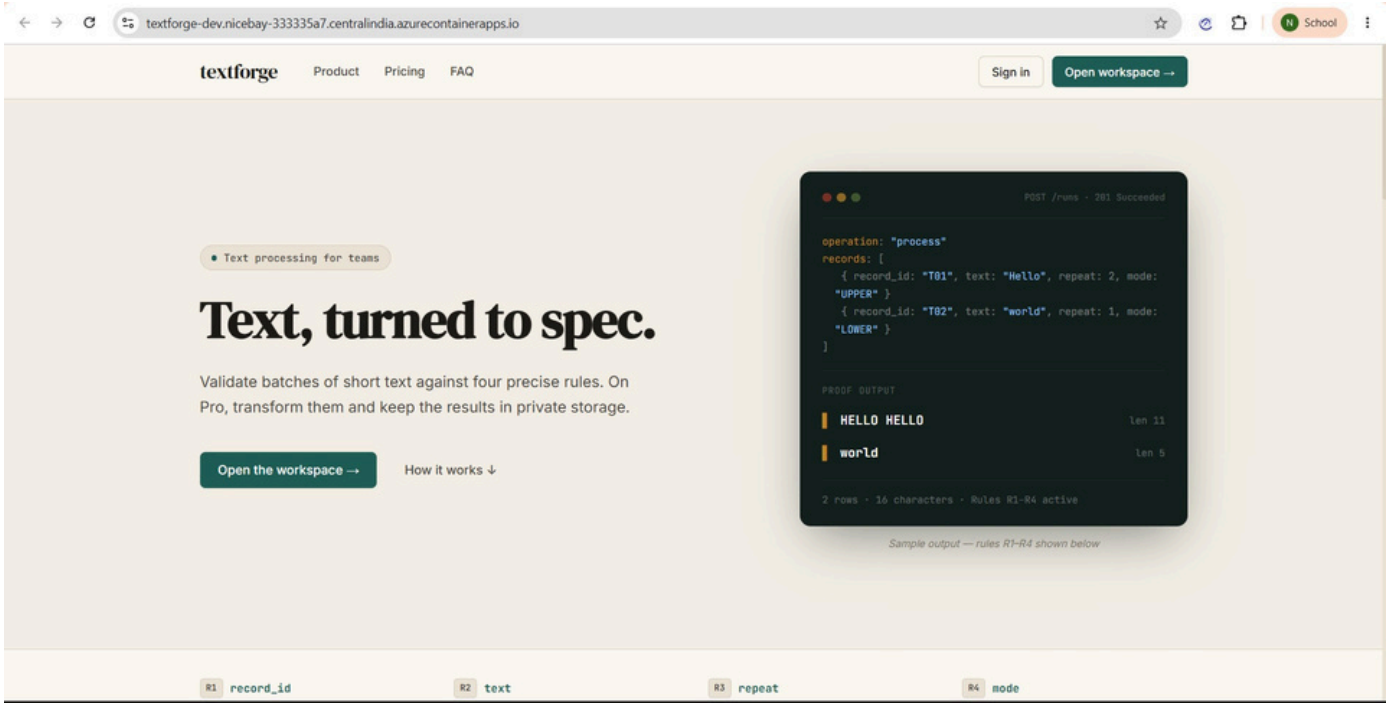

Figure 1: Application running

3. Deployed Application Version

Field	Details
Deployment method	Azure Container Apps

Field	Details
Container image registry	Azure Container Registry
Registry name	acrtextforge8291
Container App Environment	cae-textforge-dev
Manage Identity	id-textforge-dev
Storage account	sttextforge8291
Container App name	textforge-dev
Container App status	Running

The deployed image version or Git commit identifies the application code associated with this deployment.

Screenshot 2 — Azure Container App

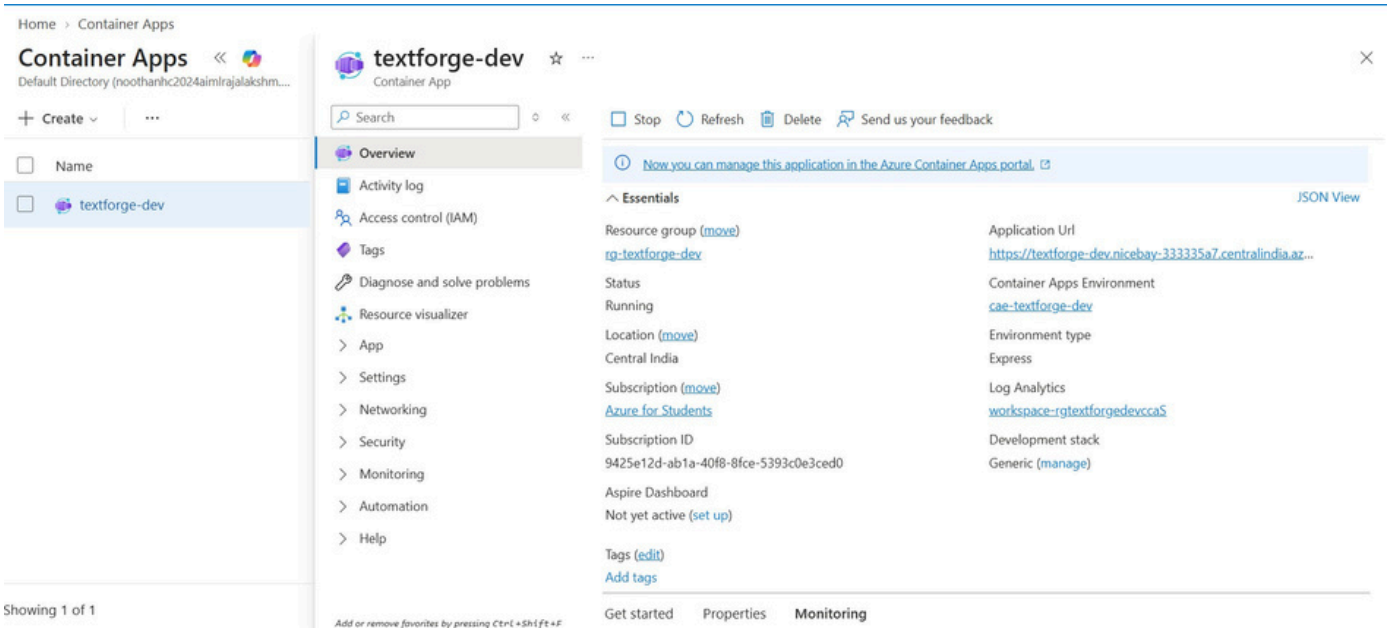

Figure 2: Container App deployment and application status in the Azure portal.

4. Azure Resources and Status

The following Azure services are used or planned as part of the application infrastructure. The status column must reflect the actual state of each resource at the time of submission.

Azure Resource	Purpose	Status
Resource Group	Groups the project's Azure resources	Running
Azure Container Registry	Stores the container image	Running
Azure Container Apps Environment	Provides the container hosting environment	Running
Azure Container App	Runs the application and exposes its URL	Running
Azure Storage Account	Provides Blob Storage	Running

Azure Resource	Purpose	Status
Private Blob Container	Stores objects privately	Running
Log Analytics Workspace	Collects and supports analysis of logs	Running

Resource Verification: Partially Verified

Screenshot 3 — Azure Resource Group

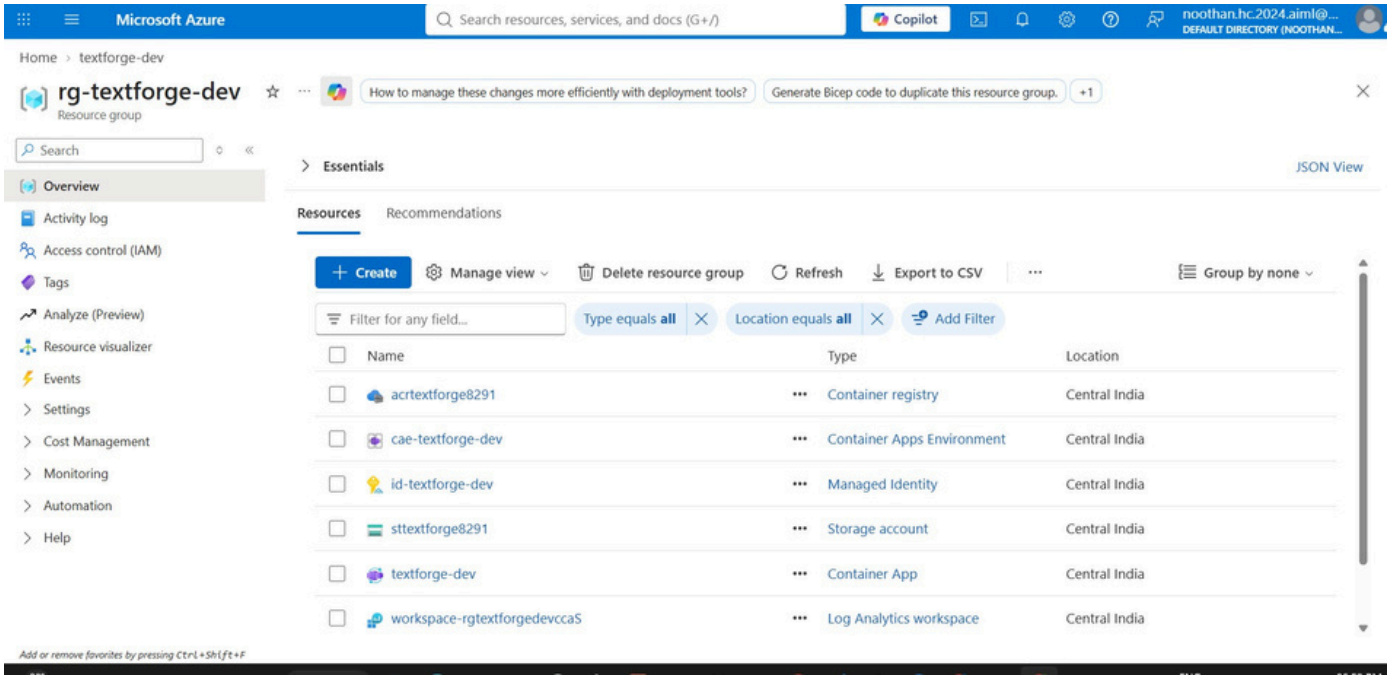

Figure 3: Azure resources associated with the application deployment.

5. Application Features and Verification

The following checks are intended to verify the deployed application against its required functionality.

Test ID	Verification Item	Expected Result	Actual Status
T01	Open the live UI URL	Application interface loads	Pass
T02	Access the health endpoint	Application reports healthy status	Pass
T03	View available tools	Available operations are displayed	Pass
T04	Submit valid input for validation	Validation results are returned	Pass
T05	Process valid text input	Processed output is returned	Pass
T06	View processing history	Previous runs are displayed	Pass
T07	Verify SQL persistence	Run and result data persist as required	Pass
T08	Verify Blob Storage integration	Required storage operations succeed	Pass
T09	Verify application logs	Relevant logs can be inspected	Pass

Only mark a test as **Pass** after completing it against the deployed application. If a feature is not yet integrated, mark it Pending or Not Applicable as appropriate.

Screenshot 4 — Application Functionality

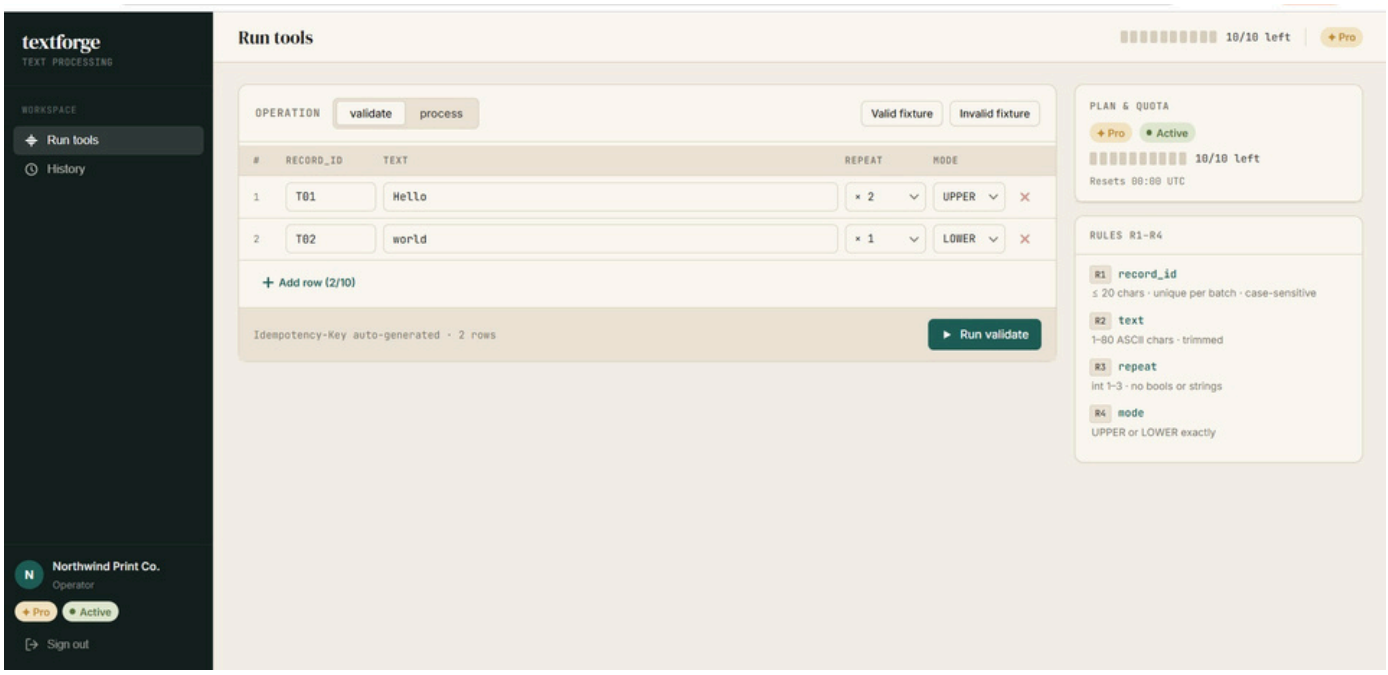

Figure 4: Successful application operation using the deployed interface.

6. Test Login Details

The following test account can be used to verify the application's functionality.

Pro Plan with As Operator

Pro Plan as Viewer

Basic plan as Operator

Basic Plan as Viewer

Preseeded Sandbox Demo Accounts

Security Note: Test credentials should be provided only through an approved secure channel. Do not include production credentials, Azure account passwords, database passwords, access keys, or connection strings in this report.

If the application does not yet have working authentication, state that test login is pending instead of inventing credentials.

7. Application Deployment and Running Steps

The following steps describe the intended deployment and verification workflow.

1. **Prepare the application:** Obtain the application source code, Dockerfile, configuration templates, and database migration scripts.
2. **Build the container image:** Package the application into a Docker-compatible container image.
3. **Push the image to Azure Container Registry:** Authenticate to the registry and upload the tagged application image.
4. **Deploy to Azure Container Apps:** Configure the Container App to run the intended image and expose the required application port.

5. **Configure application settings:** Set the required environment variables, database connection configuration, and Blob Storage authentication.
6. **Initialize the database:** Apply the required SQL migrations and verify the necessary tables.
7. **Verify the deployment:** Open the live URL, check the health endpoint, and exercise the required application features.
8. **Inspect logs:** Use Azure's logging facilities to investigate startup failures, configuration problems, and application errors.

These are deployment steps, not a claim that every step has already succeeded. The final report should reflect the actual deployment process used by the team.

8. Logging and Monitoring

Logging Service: Azure Log Analytics

Log Analytics Workspace: workspace-rgtextforgedevccaS

Verification Status: Verified

Application and platform logs are used to help diagnose deployment failures, application startup issues, and runtime errors.

Screenshot 5 — Application Logs

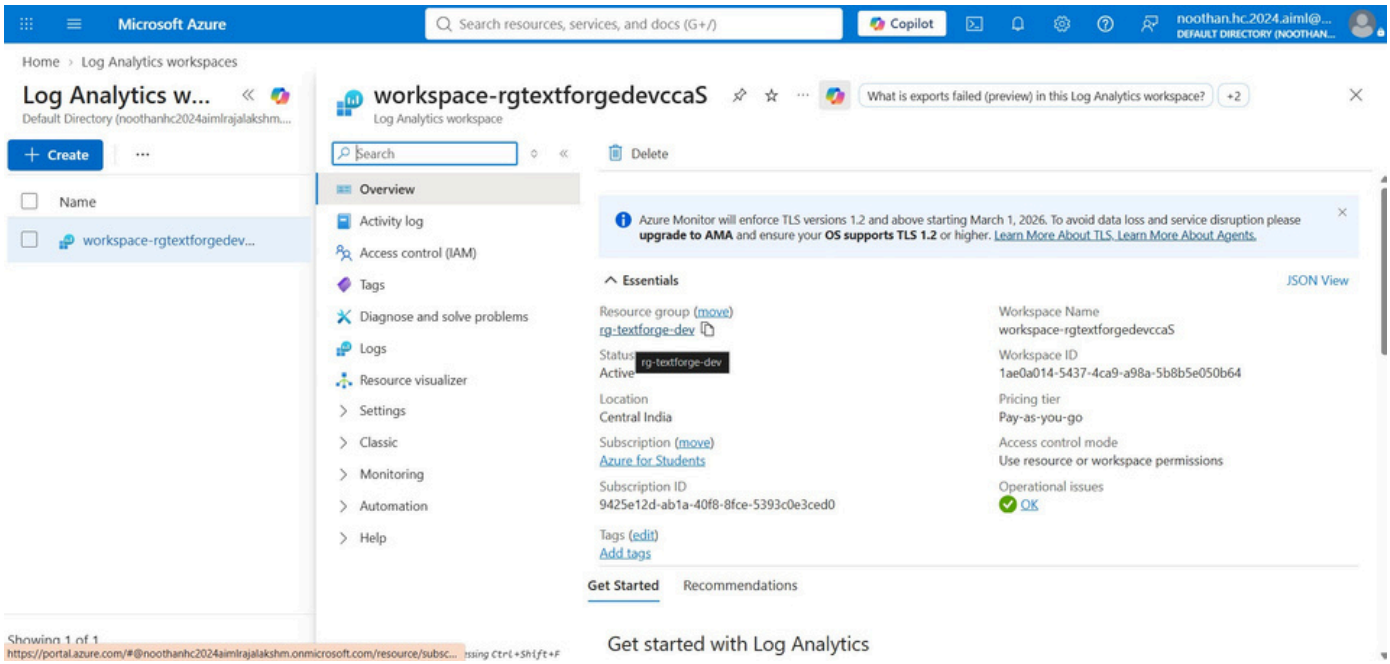

Figure 5: Application or platform logs used to verify deployment health.

9. Deployment Summary

The deployment report records the live application endpoint, deployed version, associated Azure resources, application verification results, and access instructions.

Final Deployment Status: Successfully Deployed

Live UI URL: https://textforge-dev.nicebay-333335a7.centralindia.azurecontainerapps.io/

Outstanding Issues: None
